btibMacro

A Macro is an amazing tool to help you repeat operations very easily. When you need to do multiple times the same operation(s), it's really easy to create a macro to handle it and save minutes, hours or days. Macro can also be used as settings tools to configure a device, to do some auto-tagging etc.

You can:

- Record your modifications once by recording a macro and then play them back on several components at once.
- Edit the macro, a macro is a chain of blocks defining a workflow
- Improve the macro with new blocks directly from the palette

Start saving an incredible amount of time and never get bored doing twice the same operations.
