Add a special event to a schedule

The connector can add a special event by sending a **CREATE_SPECIAL_EVENT** command to any schedule in a device.

Prerequisite

You must target:

- an existing Device with a DeviceExt through the deviceId.
- an existing ControlSchedule (BooleanSchedule, EnumSchedule, NumericSchedule or StringSchedule) with a ScheduleExt through the scheduleId.

You must also provide an unique id to the event.

Example

Example

```
{
  "type": "CREATE_SPECIAL_EVENT",
  "deviceId": "Folder_I0Stk9eSboFsjerkRdyA6",
  "scheduleId": "BooleanSchedule_l0StkHQXUQFVrZuej7UiA",
  "payload": {
    "eventId": "MyId",
    "eventName": "MyEvent",
    "startDate": "2022-01-07T09:03:48Z",
    "endDate": "2022-01-07T10:03:48Z",
    "value": true
  }
}
```

The way that the different values are extracted from the Json can be changed in the connector advanced config.

EventId

By default, it is required to manually add an eventId to your command but you can also auto generate an id for your new events if you put {uniqueString} inside the NewEventId slot inside the advancedConfig of your connector.
