

# SFormatArtifact

## Summary

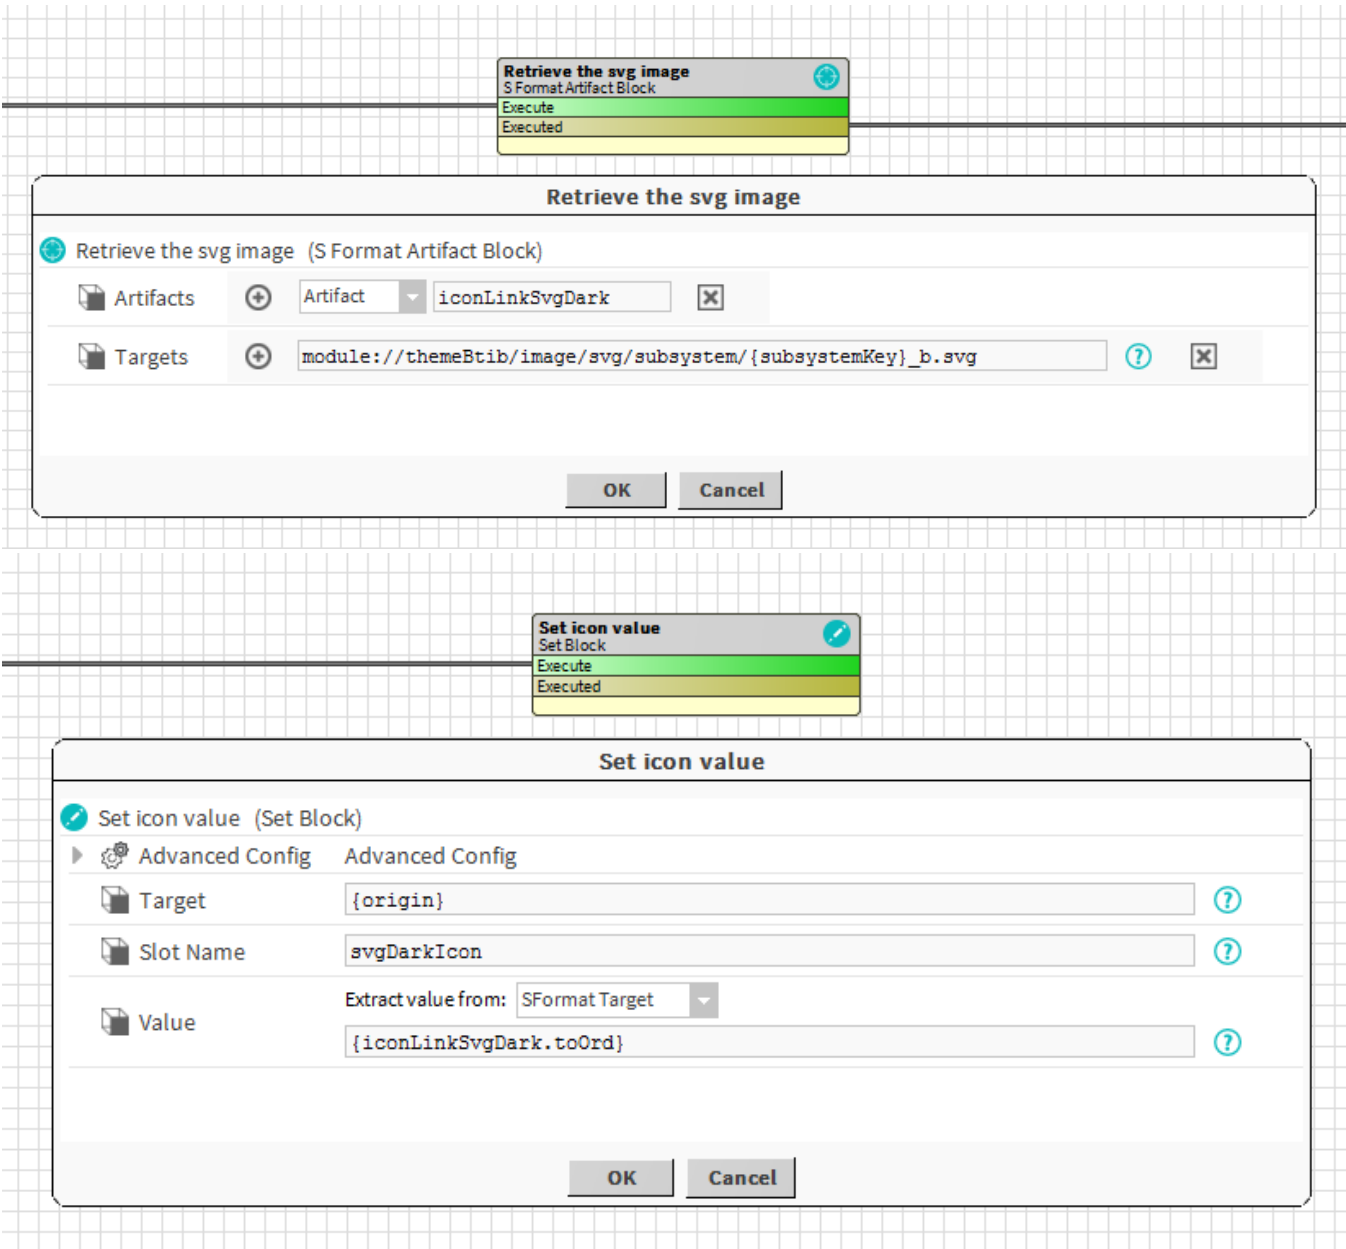

This block is used to create a new artifact from a [SFormat](#). This artifact will then be used in the following blocks.

## Implementation

- Drag and drop the block from the palette
- Link the "execute" action from the "executed" topic of the previous block

## Example

This block creates an artifact representing an icon retrieved from a subsystem in a theme module. The Artifact (the ord to the icon) is then used in another block to set a slot.

## Properties

- *Artifacts*: Artifacts created by this block. Be careful, the artifact is an array, you will need sometimes to use `.first` in a `SFormat`.
- *Targets*: [SFormat](#) to define the artifact. Note you can combine several targets in the same artifact.

**Behavior: DO & UNDO**

An artifact will be created.
